Problem Solving in Respiratory Medicine and Allergy

This book provides up-to-date solutions, based on the latest evidence, which will assist the doctor to formulate his or her treatment strategy. The book provides a selection of interesting problems for review by the hospital doctor or GP. A series of questions leads the reader logically through a case presentation, work-up, diagnosis, and discussion of recent literature. Each case is concisely presented, including an algorithm, where appropriate, to show overall management strategies.

This is a user-friendly resource for quick review and assessment of individual cases, covering the most common yet challenging cases seen by respiratory doctors. It is extremely useful as a reference and training resource in the hospital, clinic, or GP’s surgery. It contains over 40 clinical presentations covering the most common yet challenging cases seen by respiratory clinicians. The focus is not just general respiratory disease, but also allergic disorders. It is an excellent training resource and provides up-to-date referencing to present recent developments in diagnosis and management.
