This monograph offers a focused look at current concepts in shoulder surgery, including arthroscopic shoulder anatomy, subacromial decompression and rotator cuff repair, shoulder instability, SLAP lesions and disorders of the long head of the biceps, adhesive capsulitis, glenohumeral and acromioclavicular joint arthritis, and more.

This resource includes chapters that present a description of a specific complication of shoulder arthroscopy in the context of patient cases, followed by a discussion of treatment options, case management outcomes, and strategies to minimize complications.
