A didactic, yet accessible presentation of electrophysiology that is useful to both the clinician and researcher.

This text covers the entire range of electrophysiologic measures that can be used in diagnosis and monitoring of neurologic diseases. It brings together EMG, EEG, evoked potentials, autonomic nervous system testing, sleep, surgical monitoring, motor control, vestibular testing, and magnetic stimulation into a single volume, and is widely used in preparing for the board exams in clinical neurophysiology.

The second edition has been thoroughly updated and expanded, and includes a new chapter on the clinical neurophysiology of pain.
