The book provides practical guidance on the management of the acute and distressing symptoms that often arise in the ill cancer patient.

This book seeks to provide an easily accessible evidence-based guide to the diagnosis and management of acutely ill patients with cancer. The scope of the book is limited to those emergencies directly caused by the cancer or by its treatment and those conditions where there is a strong predisposition caused by the cancer. Many of these emergencies will be familiar to non-oncologists, however others will not. Any delay caused by unfamiliarity can have disastrous results, for example irreversible neurological deficit in unrecognized spinal cord compression. Not all the emergencies covered in this book require immediate recognition and treatment to prevent potential fatal outcomes, however, all these conditions require urgent action to reduce morbidity and distressing symptoms for patients.
