Problem Solving in Women's Health

Five gynecologists affiliated with John Radcliffe Hospital, the University of Oxford, and Royal Adelaide Hospital provide 50 case studies illustrating menstrual problems, menopause, fertility and contraception, gynecological emergencies, sexual problems, urogenital conditions, prevention and screening, and gynecological cancer.

This new volume brings together the current thinking in both investigation and management of the female patient requiring treatment for gynaecological, reproductive and menopausal conditions. It presents a comprehensive caseload as seen by the practicing clinician, presenting common yet challenging real-life patient scenarios, which the authors resolve by drawing on the latest published literature.

Appropriate for both medical students and practicing clinicians, the case studies begin with a case history, then discuss relevant background statistics and research evidence, risk factors, likely investigations to order, treatment options, and recent developments.
