Revised to reflect the new, clinically-focused certification exams, this edition offers a complete review for radiology residents and radiologic technologists preparing for certification.

This new edition covers x-ray production and interactions, projection and tomographic imaging, image quality, radiobiology, radiation protection, nuclear medicine, ultrasound, and magnetic resonance – all of the important physics information you need to understand the factors that improve or degrade image quality. Each chapter is followed by 20 questions for immediate self-assessment, and two end-of-book practice exams.
