The impact of psychological research and expert testimony on legal changes, police practice and legal judgements in England and Northern Ireland is unparalleled in the rest of the world and valuable lessons have been learned as a result. A number of high profile murder and terrorist convictions based largely on confession evidence have been quashed on appeal. In The Psychology of Interrogations and Confessions, Gisli Gudjonnson traces the scientific advances and relevant cases, many of which he was directly involved with, and demonstrates their legal and psychological significance.

False confessions do occur and no legal system can afford to deny that serious mistakes have been, and will continue to be, made without radical change. The Psychology of Interrogations and Confessions is a comprehensive and authoritative handbook that demonstrates the crucial relationship between research and practice.

In Part I, interrogation tactics used by the police in the USA and Britain are reviewed and the reasons why suspects confess to crimes are examined. In Part II, differences between English and American legal systems are highlighted and the concepts of suggestibility, compliance and acquiescence are discussed in detail, along with the effects of drugs and alcohol. Twenty-two leading disputed confession cases are presented and evaluated in Part III, showing how high court judges have become more sophisticated in the way they admit and rely on expert psychological and psychiatric testimony. Part IV provides a detailed discussion of seven high profile cases from outside Britain. They demonstrate how different legal systems approach, view and evaluate disputed confession evidence and expert testimony, providing material of international significance.
