Instant access to the backfile - Issues Volume 1, Issue 1 to issues published in 2008 - of a premier publication that offers practical, hands-on coverage of the latest in cost-effective, evidence-based diagnostic and case management approaches.

The journal gives clinicians the know-how they need to perform an efficient workup...select therapies that are both medically effective and cost-efficient...and anticipate complications in the course of treatment. Each quarterly issue features real-world case studies of a wide range of problems, selected according to their frequency, severity, expense, and impact on quality of life. Cases involve infants, children, adolescents, and their families. Each case study is documented throughout its natural history, enabling readers to see the diagnostic and therapeutic uncertainties during the course of the illness and evaluate decisions at critical points.
