Global Reproductive Health is an international, multidisciplinary journal published on behalf of the International Federation of Fertility Societies (IFFS).

Its aims are to further knowledge, foster innovation, support research and promote good clinical practice in the field of reproductive medicine within a global setting. Contributions are welcome from healthcare professionals and researchers in the following areas: fertility control, periconceptual health, sexual health, reproductive genetics, early pregnancy loss, gynaecological practice related to reproductive health, reproductive surgery, imaging, epidemiology of reproduction, service delivery, science and practice of assisted reproduction, quality and safety systems and health economics relevant to this area. The journal will also publish peer-reviewed articles and refereed abstracts arising out of the activities of the IFFS, its various educational activities and conjoint meetings held with other organisations, subject to agreement. All published research articles in this journal have undergone rigorous peer review, based on initial editor screening and anonymous reviewing by independent reviewers. We are also open to submissions which may include original papers, reviews, policy statements, commentaries, debates, correspondence, reports of sessions at meetings, refereed abstracts from our meetings and, subject to individual agreement, those meetings that we hold conjointly with other organisations. Submissions are particularly welcome in respect of research undertaken in reproductive medicine in developing health economies and resource poor settings.
